

ORDER ACCELERATION THROUGH USER DOCUMENT STORAGE AND
REUSE

ABSTRACT OF THE DISCLOSURE

An electronic commerce system for order acceleration through user document reuse includes one or more document repositories that stores a plurality of user documents. The system also includes a global content directory that includes a plurality of product and document classes organized in a hierarchy where each class categorizes a number of documents and is associated with one or more attributes of the documents categorized in the class. The system further includes a search interface to search the user documents. A security module encrypts the user documents and decrypts the user documents when a buyer has the required permission level. An intelligence module updates one or more sections of the user documents with current information so that a buyer can reuse the user document to accelerate an order.
